

The Roadman Climbing Checklist

Week 6 -- Five Fixable Reasons | The Roadman Method

Five fixable reasons your climbing is slow.

1. Pacing

Fix: Negative split: start at 90% target power, build through the middle, finish strong.

2. Power-to-Weight

Fix: Body comp via Module 8 -- small deficits on easy days, never on quality days.

3. Cadence

Fix: Find 70-85 RPM for sustained climbs. Shift to an easier gear.

4. Fuelling

Fix: 60-90g carbs/hour. Eat your last gel 10 min before the climb.

5. The Mental Game

Fix: Replace 'I can't hold this' with 'I'm choosing to hold this for 60 more seconds.'
